

## DRIVER MAPPING & ROUTE RISK

# RouteMaps

## RouteMaps

Track Access Driver Route Maps have been used throughout the UK rail industry by Train Operators and Network Rail. They are based on the TRACK ACCESS common mapping format which provides driver information in a clear and precise layout. Designed in a flexible format which provides options to distribute maps as a whole manual or in smaller sections. The format is used by many operators throughout the UK and Ireland including C2C, NXEA, FCC, HEX, LORAL, Translink and Iarnród Éireann. The manual contains a clear symbol set which is backed up by both route risk and signal indication information. Local instructions, photographs and other 'operator specific' information can be added. The manual also contains a comprehensive version control system allowing for single page replacement and the format is ideal for web delivery and viewing using mobile devices.

## FEATURES

- Full colour easy to read format
- Compact construction, easy to maintain
- Clear identification of all driver related features
- Clear and consistent symbol set
- Route risk highlights
- Local instruction section
- Signal Information and routing section
- Comprehensive version control
- Sectional construction for partial distribution
- Ideal for website storage and distribution
- Links to computer moving map
- Used fully or partially throughout the industry

*E learning for the future*
